

SAYS

- "Deepfakes are becoming a huge threat to digital security and media authenticity."
- "I want a reliable solution that can accurately differentiate between real and fake images."
- "The system should be user-friendly and offer clear visual explanations."
- "I need it to handle real-time analysis and give quick, accurate results."
- "GradCAM visualizations should make it easy to understand the model's decisions."

THINKS

- "Is the detection robust enough to handle high-quality deepfakes?"
- "How reliable is the system when processing images with varying resolutions and conditions?"
- "Can this system be extended to video analysis in the future?"
- "The transparency of GradCAM is important for building trust in AI decisions."
- "Scalability and real-time processing are critical for broader applications."

DOES

- **Uploads images to the system for detection and validation.**
- **Checks the GradCAM heatmaps to interpret model predictions.**
- **Uses the interactive Gradio interface for testing multiple images.**
- **Analyzes classification results to evaluate the system's reliability.**
- **Adjusts thresholds to improve sensitivity based on use-case requirements.**

FEELS

- **Concerned** about the spread of manipulated images and misinformation.
- **Confident** when the system successfully detects deepfakes with clarity.
- **Empowered** by the interpretability and transparency provided by GradCAM.
- **Secure** knowing the system helps identify fake content in real-time.
- **Curious** about the inner workings of machine learning and deep learning models.
