deepFake Image Detection

Akshay Jadhav, Unmesh Kakuste, Gajanan Shingare and Satyam Shinde

Fake 100%

User Requirement	Proposed Solution
Accurate Detection: Users need a system that can reliably distinguish between real and deepfake images.	Develop detection system to ensure high accuracy in identifying deepfake images.
User-Friendly Interface: The system should be easy to use and interpret results.	Have clear and understandable results
Real-Time Analysis: Users require timely detection of deepfakes for quick response.	Implement efficient processing algorithms
Scalability: The solution should handle large volumes of images.	Design a scalable system architecture to manage and analyze large datasets effectively.

Problem statement

As deepfake technology becomes more advanced, there is a growing need for an accurate detection system to safeguard digital content integrity, prevent misinformation, and protect individuals and organizations from the risks posed by deceptive images.

Proposed Solution

Create a robust detection system to identify deepfake images accurately, ensuring the integrity of digital content and helping to prevent the spread of misinformation. This system will offer clear, understandable results to support informed decision-making and maintain trust in visual media.

Scope and Feasibility

Develop a deepfake detection system for improved content verification across various industries. Feasible with current AI models and datasets, ensuring accurate and practical solutions.
